Objectives

Discuss brief history of MS Word.

Take a quick look on the previous interfaces of MS Word.

Identify basic parts of an MS Word interface.

Introduction to Microsoft Word

- Microsoft Word, word-processor software launched in 1983 by the Microsoft Corporation.
- Software developers Richard Brodie and Charles Simonyi joined the Microsoft team in 1981, and in 1983 they released Multi-Tool Word for computers that ran a version of the UNIX operating system (OS).
- Later that year, the program was rewritten to run on personal computers (PCs), such as the IBM PC, under Microsoft's version of DOS (disk operating system), or MS-DOS, and was renamed Microsoft Word.
- The product was in direct competition with WordPerfect and WordStar, both of which were introduced for PCs in 1982.

Introduction to MS Word

- Like WordStar, Word was **WYSIWYG** (*what you see is what you get*), meaning that formatting tags were hidden and whatever a document looked like on a user's computer screen was how it would look when printed—or at least semi-WYSIWYG, as screen fonts were not of the same quality as printer fonts.

Introduction to MS Word

- Microsoft's program was the first to make extensive use of the computer mouse to display styles on-screen (italic, bold, and underlined text), and to feature style sheets and multiple windows (i.e., separate work spaces for editing multiple documents).
- Version 2.0, released in 1985, included spell-check and word-count options; subsequent versions included significant upgrades and improvements.
